

# The `rpgicons` package

A set of high-quality icons for use in notes for tabletop role-playing games

Jasper Habicht \*

Version 2.9.0, released on 30 April 2026

---

## 1 Introduction

The `rpgicons` package provides a set of high-quality icons for use in notes for tabletop role-playing games. The icons are meant to be used in the body text, but they can also be used in other contexts such as graphics or diagrams.

The package comes in two variants, a L3 variant based on the `l3draw` package which is loaded per default and a PGF variant based on PGF/TikZ.

## 2 Loading the package

To install the package, copy the relevant package files `rpgicons.sty`, `rpgicons-l3.sty` and `rpgicons-pgf.sty` as well as `rpgicons.lua` into the working directory or into the `texmf` directory. You may want to use a TeX package manager for this. After the package has been installed, the `rpgicons` package is loaded by calling `\usepackage{rpgicons}` in the preamble of the document.

The file `rpgicons.sty` acts as a wrapper that loads either the file `rpgicons-l3.sty` or `rpgicons-pgf.sty` depending on the variant of the package that is used. Therefore, if only one of the variants should be used, technically speaking it is sufficient to only install one of these two files and load the package using `\usepackage{rpgicons-l3}` or `\usepackage{rpgicons-pgf}` respectively. Note, however, that the file `rpgicons.lua` needs to be installed if the L3 variant is used with LuaLaTeX.

The package can be loaded with one of the following options.

**`l3`**

The L3 variant of the package is loaded by default. To load it explicitly, the package can be loaded using the option `l3`.
