v2.02k (2020/11/26)

The **svg** package is intended for the automated integration of SVG graphics into L^AT_EX documents. The capabilities provided by **Inkscape**—or more precisely its command line interface—are used to export the text within a SVG graphic to a separate file, which is then rendered by L^AT_EX. The two commands `\includesvg` and `\includeinkscape` are provided as central user-interface, which are very similar to the `\includegraphics` command of the **graphicx** package.

In addition, the package **svg-extract** allows the extraction of these graphics into independent files in different graphic formats, exactly as it is rendered within the L^AT_EX document. For the creation of these graphics in the well-known formats PDF, EPS and PS, L^AT_EX and possibly conversion tools shipped with the distribution are used. If the graphics are required in other file formats, either **ImageMagick** or **Ghostscript** can be invoked.

The command line interface (CLI) of **Inkscape** 1.0 has changed in comparison to previous versions. In order to provide a comfortable user-interface for invoking **Inkscape**, the used version is detected and if necessary switch to the outdated syntax of the CLI. If this approach fails for some reason, you can set the version of **Inkscape** manually with `inkscapeversion=0` or `inkscapeversion=1`.
