

The TikZducks package

using ducks in TikZ

samcarter

<https://ctan.org/pkg/tikzducks>

Version v2.2 – 2025/12/11

1 Introduc(k)tion

Rubber ducks can be made of latex, but can they also be made with L^AT_EX? Yes! The TikZducks package is a L^AT_EX package for rubber ducks to be used in TikZ pictures. This project is a continuation of [How can we draw a duck?](#).

Without the friendly and helpful community of T_EX users this package would not exist. A big thanks to all the users and contributors of this package!

This package is work in progress, therefore I would be happy to hear your feedback and ideas how to improve the package. The development version of the source code can be found at <https://github.com/samcarter/tikzducks>, including an issue tracker. A more stable version of the package can be found on CTAN (<https://ctan.org/pkg/tikzducks>) and is included in both T_EXLive and MiK_TE_X as `tikzducks`. If you seek any other assistance (not bug reports/feature requests), I suggest asking at <https://topanswers.xyz/tex>.
