

The duckuments package

Jonathan P. Spratte*

version 0.5, released 2019-10-03

Contents

1	Introducttion	1
2	Duckumentation	2
2.1	Ducky content	2
2.2	Other Macros	2
2.3	Patches	3
2.4	Options	3
3	Implementation	4
3.1	Check for possible problems	4
3.2	Variables	5
3.3	Constants	6
3.4	Messages	8
3.5	Options and Configurations	9
3.6	Functions	10
3.6.1	Duckument Level	10
3.6.2	Intern	12
4	The story of the duck	20

1 Introducttion

This package was inspired by the question [getting ducks in example images](#). It began on the idea to patch `\includegraphics` to automatically change its behaviour if `example-image-duck` is used, but then it turned out to be a simple alternative to the `blindtext` package.

It is written as a docstrip file: executing `latex duckuments.dtx` generates the `duckuments.sty`, `example-image-duck.tex`, and `example-image-duck-portrait.tex` file and typesets this duckumentation; execute `tex duckuments.dtx` to only generate the files `duckuments.sty`, `example-image-duck.tex`, and `example-image-duck-portrait.tex`.

For its functionality `example-image-duck.tex` and `example-image-duck-portrait.tex` must be compiled at least once. The sources are hosted on [github](#).
