This document is also available as HTML (`glossaries-user.html`).

Abstract

The glossaries package provides a means to define terms or acronyms or symbols that can be referenced within your document. Sorted lists with collated locations can be generated either using $\text{\TeX}$ or using a supplementary indexing application. Sample documents are provided with the glossaries package. These are listed in §18.

glossaries-extra

Additional features not provided here may be available through the extension package `glossaries-extra` which, if required, needs to be installed separately. New features will be added to `glossaries-extra`. Versions of the glossaries package after v4.21 will mostly be just bug fixes or minor maintenance. The most significant updates to the glossaries package since then is version 4.50, which involved the integration of `mfirstuc` v2.08 and the phasing out the use of the now deprecated `textcase` package, and version 4.55, which involved the integration of `datatool-base` v3.0.

Note that `glossaries-extra` provides an extra indexing option (`bib2gls`) which isn't available with just the base glossaries package.

If you require multilingual support you must also install the relevant language module. Each language module is called `glossaries-⟨language⟩`, where `⟨language⟩` is the root language name. For example, `glossaries-french` or `glossaries-german`. If a language module is required, the glossaries package will automatically try to load it and will give a warning if the module isn't found. See §1.5 for further details. If there isn't any support available for your language, use the `nolangwarn` package option to suppress the warning and provide your own translations. (For example, use the `title` key in `\printglossary`.)
