1 Introduction

This class produces a book cover suitable for Kindle Direct Publishing (KDP). The author employs it for [a number of his books](#). A L^AT_EX document conforming to this class takes the following form:

The problem addressed by this class is the necessity of adjusting the size of the cover PDF in accordance with the number of pages within the book—the more voluminous the book, the broader its spine must be. The class performs the requisite calculations on the fly by means of the `qpdf` tool, which must therefore be installed. The `pdflatex` processor must furthermore be invoked with the `--shell-escape` option, so that L^AT_EX may execute `qpdf`.
