Lisnoti

A sans serif font for text and maths

Version 2.004 (2026-09-29) · Tim Gordon

1 Introduction

Lisnoti (/lɪz'nəʊti:/) is a proportional sans serif font for everyday use, with clear, unambiguous letters and coverage of Latin, Greek, Cyrillic and Devanagari character sets. It is particularly strong for maths, science and actuarial work, including typesetting equations, and comes in regular, *italic*, **bold** and ***bold italic***.

Lisnoti is derived from Google's Noto fonts, including Khaled Hosny's 2024 redesign of Noto Sans Math, but with numerous amendments to improve clarity and consistency.

The font includes OpenType MATH tables, which means unicode-math can use Lisnoti for equations as well as text – this document is set entirely in Lisnoti.

Lisnoti differences from Noto:

- No lookalikes: capital I, small l and number 1 are always distinct, as are capital O and number 0:

  Il1 O0 *Il1 O0* **Il1 O0** ***Il1 O0***

- Character classes redrawn (set operators and radicals) or rescaled (*n*-ary operators):

  $\in \notin \subset \not\subset \subseteq \not\subseteq \cap \cup \surd \bigcap \bigcup \sum \prod$

- Consistent Unicode superscripts and subscripts, which means plain text such as $x^2 + y^2 = r^2$, H_2O and a_{ij} can be written without maths mode.

- Relevant characters grouped in a single font, including Greek, Cyrillic, Unicode mathematical alphanumerics, arrows, geometric shapes, ticks and crosses, box drawing and every currency sign in Unicode.

2 Installing

The lisnoti package installs its four font files where your TeX distribution can find them:

- In TeX Live, run tlmgr install lisnoti.
- In MiKTeX, open MiKTeX Console, go to *Packages*, search for lisnoti, select it and click +. Or, at a command prompt, run miktex packages install lisnoti.

Or you can install the fonts via your operating system in the usual way and let fontspec find them there. The font files are available at https://github.com/Lisnoti/Lisnoti.
